

ext Commands (ext = extension):

The ext: search operator can be used to find web pages that have a specific file extension.

To use the ext: operator, simply type the file extension after the command. For example, to find all web pages that have the PDF file extension, you would type the following query:

ext:pdf

You can also use the ext: operator in conjunction with other search operators to further refine your search results. For example, to find all web pages on the Ford website that have the PDF file extension, you would type the following query:

site:https://www.ford.com/ ext:pdf

Google will return a list of all web pages that match your search query.

Here are some tips for using the ext: search operator effectively:

- Be specific with your file extension. The more specific your file extension is, the more likely you are to find the results that you are looking for.
- Use the site: operator to limit your search to a specific website.
- You can also use other search operators, such as date: and daterange:, to further refine your search results.
