

inurl Commands:

The inurl: search operator can be used to find web pages that have a specific keyword or phrase in their URL.

To use the inurl: operator, simply type the keyword(s) or phrase that you are looking for after the command. For example, to find all web pages that have the keyword "tesla" in their URL, you would type the following query:

inurl:tesla

You can also use the allinurl: operator to find web pages that have all of the specified keywords or phrases in their URL. This can be useful for finding information on specific topics. For example, to find all web pages that have the keywords "tesla" and "lambo" in their URL, you would type the following query:

allinurl:tesla lambo

Google will return a list of all web pages that match your search query.

Here are some tips for using the inurl: and allinurl: operators effectively:

- Be specific with your keywords. The more specific your keywords are, the more likely you are to find the results that you are looking for.
- Use quotation marks around phrases to search for them as exact matches. For example, to find all web pages that have the phrase "tesla model s", you would type the following query:

inurl:"tesla model s"

- Use the allinurl: operator to find pages that contain all of the specified keywords or phrases in their URL. This can be useful for finding information on specific topics.
