Site Commands:

The site: search operator can be used to find web pages on a specific website.

To use the site: operator, simply type the website address after the command. For example, to find all web pages on the Honda website, you would type the following query:

site:https://global.honda/

Google will return a list of all web pages on the specified website that match your search query.

The site: operator can be used in conjunction with other search operators to further refine your search results. For example, to find all web pages on the Honda website that contain the keyword "car", you would type the following query:

site:https://global.honda/ car

You can also use the site: operator to find web pages on multiple websites. For example, to find all web pages on the Honda and Toyota websites that contain the keyword "car", you would type the following query:

site:https://global.honda/ car OR site:https://www.toyota.com/ car

Here are some tips for using the site: search operator effectively:

- Be specific with your keywords. The more specific your keywords are, the more likely you are to find the results that you are looking for.
- Use quotation marks around phrases to search for them as exact matches.
- Use the OR operator to find web pages on multiple websites.
- You can also use other search operators, such as date: and daterange:, to further refine your search results.
